/note="Vector: Lambda Uni-ZAP XR, excised phagemid; Site_1: EcoRI; Site_2: XhoI; Seeds were surface-sterilized, germinated and grown aseptically in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedlings were transferred to 5 cold room and kept for 48 hr. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all

SeedS were surface sterilized then germinated under axenic
Conditions in the dark at room temperature on filter paper
with water, nystain and cefotaxime in covered
crystallization dishes. Five-day old seedling roots were
then harvested, total RNA was prepared, poly(A) RNA was
purified, one primary unamplified cDNA library was made,
and 1 million pfu were in vivo excised to give pBluescript
SK(-) CDNA phagemids. These steps were performed in the TJ
Close laboratory at the University of California,
Riverside (Choi, Close, Fenton). Phagemids were plated and
picked at the clemson University Genomics Institute (CUGI)
(Begum, Palmer, Firsch, Arkins and Wing). Plasmid DNA
preparations, DNA sequencing and sequence analysis were
performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates
vector, sequence and contains a minimum of 100 bases of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               http://www.genome.clemson.edu/projects/barley. /clone=11b="Lambda-PRL2"
/note="Vector: lambda zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and sliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. 83 t 8 others

Site_1: XhoI; Site_2: EcoRI; Four-week-old sorghum
seedlings were sprayed with spore suspension prepared from
3-week-old FRMA2I, a sorghum isolate of the anthracnose
pathogen Colletotrichum graminicola. Inoculated plants
were kept in a 25 C dark growth chamber with 100% relative
humidity for 24 hr, followed by 12/12 hr of light/dark
cycle at 25 C with 90% relative humidity for another 24
hr. All leaves were harvested and quick frozen with liquid
nitrogen and stored in a -80 C freezer. The library was
made from poly-A RNA in the cloning vector lambda ZaP II.
Clones to be sequenced were prepared by mass excision.
WARNING: While most or all ESTs are expected to derive
from the host plant, no effort was made to eliminate ESTs
deriving from the pathogen.

Patent No. 5866410

GENERAL INFORMATION:
APPLICANT: Ryan, Michael J.
APPLICANT: Etrathy, Nancy
APPLICANT: Fantih, Susan E.
TITLE OF INVENTION: Cloung of the biosynthetic pathway for TITLE OF INVENTION: useful therein
NUMBER OF SEQUENCES:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                               SIDSI/gcgdata/geneseq/geneseqn-embl/NA1980.DAT:*

triangly grant a portion (see AA732306) of corn acid triangly glycarol lipase (TAGL). The clone was isolated from a corn triangly glycarol lipase (TAGL). The clone was isolated from a corn leaf cDNA library. Novel acid acid explained by the corn acid catalpa, rice, soybean and wheat tissues are disclosed. The enzymes may be prepared recombinantly and used to raise antibodies, which care used for detecting the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides may be used to create transgenic plants in which the TAGL levels are present at higher or lower levels than normal, or in cell types or developmental processes where they are not normally found. This would alter the level of triacylglycerol and constant of setzery lesters found in those cells. Accumulation of fatty acids with unusual structures may be desirable to eliminate expression of TAGL genes for certain applications. TAGL enzymes may also be useful for the processing of plant seed oils and for the development of novel seed clis. The TAGL enzymes can also be used as targets to facilitate the desiral as herbicides. This is desirable because inhibition of the activity of either of the enzymes could lead to an inhibition of the growth. The polynucleotides also serve as a source of probes and primers, which are useful for genetic mapping, as markers for traits in the constant of primers, which are useful for genetic mapping, as markers for traits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó

Novel plant triacylglycerol lipase polynucleotides used to alter the

level of the enzyme in transgenic plants

Claim 2; Page 48; 65pp; English.

This is the nucleotide sequence of a contig assembled from the entire cDNA insert in clone $81.0k002.al and a portion of the cDNA insert in clone $81.0k002.al and a portion of the cDNA insert in clone $81.0k004.n3 encoding the entire soybean activities (TAGL) (see AAX12309). The clones were isolated from soybean developing pod and seedling (5-10 day post germination) cDNA libraries. Novel acid and neutral TAGL polypeptides (See AAX12301-17) and polynucleotides (see AAX12301-17) and polynucleotides (see AAX12301-17) and polynucleotides (see AAX12301-17) and wheat tissues are disclosed. The enzymes may be prepared recombinantly and used to raise antibodies, which care used for detecting the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides may be used to create transgenic than normal, or in cell types or developmental processes where they are not normally found. This would alter the level of triacylglycerol and cholesteryl esters found in those cells. Accumulation of fatty acids with unusual structures may be desirable to eliminate expression of TAGL genes for certain applications. TAGL enzymes may also be useful for the processing of plant seed oils and for the development of novel seed oils. The TAGL enzymes can also be used as targets to facilitate the useful as herbicides. This is deasirable because inhibition of the activity of either of the enzymes could lead to an inhibition of plant carried primers, which are useful for genetic mapping, as markers for traits primers, which are useful for genetic mapping, as markers for traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                24 cagctctactggaactggtcctgggatgacctggtagtcaacgacctgccggccatggtc

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and call-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence data for this patent did not form part of the printed cification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

```
This is the nucleotide sequence of the CDNA insert in clone

"Ir72.pk0015.b2 encoding the entire rice acid triacylglycerol

Ilpace (TAGL) (see AAY23307). The clone was isolated from a rice

[lose CAA32301-17) and polynucleotides (see AAZ34950-66) from corn,

Catalpa, rice, soybean and wheat tissues are disclosed. The enzymes

CC Catalpa, rice, soybean and wheat tissues are disclosed. The enzymes

CC catalpa, rice, soybean and wheat tissues are disclosed. The enzymes

CC catalpa, rice. Soybean and wheat tissues are disclosed. The enzymes

CC catalpa, rice. Soybean and wheat tissues are disclosed. The enzymes

CC catalpa, rice and used to raise antibodies, which

are used for detecting the enzymes in situ in cells or in vitro in

cell extracts. The Problynucleotides may be used to create transgenic

plants in which the TAGL levels are present at higher or lower levels

than normal, or in cell types or developmental processes where they are

cond normally found. This would alter the level of friacylglycerol and

cholesteryl esters found in those cells. Accumulation of fatty acids

with unusual structures may be desirable to eliminate expression of TAGL

concessing of plant seed oils and for the development of novel seed

colls. The TAGL enzymes can also be used as targets to facilitate the

design and/or identification of inhibitors of those enzymes that may be

considered to feither of the enzymes could lead to an inhibition of plant

contivity of either of the enzymes can a source of probes and

contivity of either of the enzymes as a source of probes and

continued to those genes, and to isolate homologous sequences from other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Seguence 1483 BP; 375 A; 334 C; 344 G; 430 T; 0 other;

The clone was isolated from a Catalpa seed cDNA library. Novel acid and neutral TAGL polypeptides (see AAX24301-17) and polynucleotides (see AAX24950-66) from corn, Catalpa, rice, soybean and wheat tissues are disclosed. The enzymes may be prepared recombinantly and used to raise antibodies, which are used for detecting the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides may be used to create transgenic blants in which the TAGL levels are present at higher or lower levels than normal, or in cell types or developmental processes where they are not normally found. This would alter the level of triacy191ycerol and cholesteryl esters found in those cells. Accumulation of fatty acids

              foods. In addition, it may be desirable to eliminate expression of TAGL genes for certain applications. TAGL enzymes may also be useful for the processing of plant seed oils and for the development of novel seed oils. The TAGL enzymes can also be used as targets to facilitate the design and/or identification of inhibitrors of those enzymes that may be useful as herbicides. This is desirable because inhibition of the activity of either of the enzymes could lead to an inhibition of plant growth. The polynucleotides also serve as a source of probes and primers, which are useful for genetic mapping, as markers for traits linked to those genes, and to isolate homologous sequences from other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL161840-ABL16175) and the encoded proteins
 with unusual structures may be a positive phenotype in plants used for

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072).

The sequence data for this patent did not form part of the printed
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

cell extracts. The polynucleotides may be used to raise antibodies, which are used to detect the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides may be used to create transgenic plants in which the TAGL levels are present at higher or lower levels than normal, or in cell types or developmental processes where they are not normally found. This would alter the level of triacylajivecrol and cholesteryl esters found in those cells. Accumulation of fatty acids with unusual structures may be a positive phenotype in plants used for foods. In addition, it may be desirable to eliminate expression of TAGL genes for certain applications. TAGL enzymes may also be useful for the processing of plant seed oils and for the development of novel seed oils. The TAGL enzymes can also be used as targets to facilitate the cesting and/or identification of inhibitors of those enzymes that may be useful as herbicides. This is desirable because inhibition of the cuseful as herbicides. This is desirable because inhibition of plant primers, which are useful for genetic mapping, as markers for traits infect to those genes, and to isolate homologous sequences from other

This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (I) to identify, inactivate or modulate genes involved in the biosynthesis of (II); (Ii) to generate a library of polyketide synthases; (Iii) for adding forosamine or trimethylrhamnose to a spinosyn or polyketide adjunction and (IV) for recombinant production of the corresponding enzymes, which are used for production of (II), their precursors or derivatives, including production of transgenic plants that express (II) and thus have increased resistance to insects. (I) are also useful as markers for sequencing of the Saccharopolyspora spinosa genome. (II) are also be used to raise specific antibodies, useful for identifying expression clones in a gene bank. Cells transformed with (I) may produce (II) at significantly increased levels or produce new derivatives of (II). This sequence represents a genomic DNA fragment of the S. spinosa genome which contains the coding regions for proteins involved in forces and polyketide synthase biosynthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     11341 aacgigctcgccggcacgitcgagitcgicggcgcgcagaactaccaacagcigctcgcc 11400

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                                             This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosymthesis of spinosyms. (I) are used (I) to identify, inactivate or modulate genes involved in the biosynthesis of adding forosamine or trimethylinamnose to a spinosym or polyketide allorance and (IV) for recombinant production of the corresponding enzymes, which are used for production of (II), their precursors or adjivone; and (IV) for recombinant production of (II), their precursors or derivatives, including production of (II), their precursors or derivatives, including production of (II), their precursors or adding have increased resistance to insects. (I) are also useful as markers for sequencing of the Saccharopolyspora spinosa genome. (II) are macrolides with insecticidal, but not antibacterial, activity, and can also be used to raise specific antibodies, useful for identifying expression clones in a gene bank. Cells transformed with (I) may produce (II). This sequence represents a genomic DNA fragment of the S. spinosa for process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                          detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           465

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Desosamine biosynthesis; macrolide; polyketide; methymycin; pikromycin; neomethymycin; narbomycin; polyhydroxyalkanoate monomer synthase; biopolymer; antiblotic; chemotherapeutic; immunosuppressant; asthma, chronic obstructive pulmonary disease; respiratory inflammation; hypercholesterolaemia; crop protection agent; ds.
                                                                                                                                                                                                                                                                                                                                                       detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tatcaggagttetgggacttcaccttccacgagatgggcaagtacgaccttccggccaat 1802

comprising a desosanthe biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryc gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, parbomycin, narbomycin, narbomycin, or combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the acrolide biosynthetic gene clusters are useful for the compounds. Recombinant or augmented cells comprising the desosamine compounds are useful for synthesis of methymycin, plkromycin, narbomycin. The alternative termination of polyketide production of biologically active macrolides. The macrolide biosynthetic compounds produced by the proteins are useful for synthesis of methymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and copyhydroxyalkanoate (PHA) monomers. The compounds produced by the polyhydroxyalkanoate (PHA) monomers. The compounds produced by the crecombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare to biomedical applications, to engineer PHA monomer synthases or to prepare communications are useful as cheart asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumcocci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. Sequences AA27190-Y77197.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1652 agatectgeagggetgeeggetgteggaggagaegtaegaggeeetggagaeggeeetet 1711
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and macrolide biosynthetic gene clusters, useful for, e .g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated and purified nucleic acid segment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             49 atgacctggtagtcaacgacctgccggccatggtcgacttcgtcgtcaaacagaccggcc 108

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is used to produce the recombinant DNA compounds of the invention. The specification describes a recombinant DNA compound expressing recombinant polyketide synthase genes in host cells for the production of narbonolide, narbonolide derivatives and polyketides that are useful as antibiotics and as intermediates in the synthesis of compounds with pharmaceutical value. The DNA compounds may also encode a Clarbydroxyalse (pick), desosamine biosynthesis and desosaminyl transferase enzymes (useful for conversion of ketolides to antibiotics), and the beta-glucosidase enzyme (involved in picromycin biosynthesis). These compounds are also useful for increasing the antibiotic activity of a compound relative to the unhydroxylated compound. The recombinant host cells are useful as genetic systems that allow rapid engineering of the narbonolide polyketide synthase. These would be valuable for creating novel ketolide analogs for pharmaceutical applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant pick hydroxylase gene of Streptomyces venezuelae useful for converting ketolides to antibiotics and as antibiotics and intermediates in the synthesis of compounds with pharmaceutical value

This is contig 002 from the recombinant cosmid pKOSO23-27 DNA sequence (see AAZ56001) which contains a Streptomyces venezuelae DNA insert. The cosmid contains open reading frames which encode the various modules of the narbonolide polyketide synthase (PKS). The invention relates to
                                                                                                                                      005;
                                                                                                                                Narbonolide polyketide synthase; PKS; cosmid pKOSO23-27; contig
ketolide; amino transferase dehydrase; hydroxylase; picromycin;
antibiotic production; narbomycin; ds.

```
cc recombinant DNA containing a coding sequence for a narbonolide PKS.

Polyketides are compounds synthesised from 2-carbon units through a series of condensations and subsequent modifications. Modulars PKSs are responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, six extender modules, come two thiosester domains. Four proteins make up the narbonolide PKS.

CC (PLCAI, PICAII, PICAII and 2, PICAII includes the loading module come extender modules 1 and 2, PICAII includes extender module 6 and a type II thiosesterase domain. The second type II thiosesterase domain. The second type II thiosesterase domain. The second type II thiosesterase and 1 of these proteins can be isolated in recombinant form from the recombinant cosmid pKOS033-27. Narbonolide is desosaminylated in S. venezuelae to yield narbomycin, the desosaminyl transferase enzyme is crecumbinant cosmid pKOS033-27. Narbonolide is desosaminylated in S. venezuelae for this conversion, and the desosaming biosynthetic genes are also found in cosmid pKOS033-27. Narbonolide (or its derivatives) con other ketolides (particularly hybrids), which may then be converted (e.g. by other enzymes recombinantly expressed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful

The nuclectide sequence of this BAC clone was generated by combining Monsanto and RGP-lapan sequencing data.
NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.
* NOTE: This is a "working draft' sequence.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.

Genes with similarity to proteins in the datubases are described
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.

The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://compbio.ornl.gov/Grail-1.3/),
GENSCAN (Chris Burge, MIT, http://CR-081.mit.edu/GENSCAN.html),
NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
http://gremlin.zool.iastate.edu/cgi.bin/sp.cgi)
Genes encoding tRNAs are predicted by tRNAscan-SE
(Sean Eddy, Washington University School of Medicine, St. Louis,
http://genome.wustl.edu/eddy/tRNAscan-SE/).
